BST 676: Biometrics II

Course Description: This course, the second of a two-semester sequence in biometrics, develops numerous techniques for constructing and rigorously evaluating point estimators, hypothesis testing procedures, and interval estimators.

Course Structure: 4 credit hours (4 hours of lecture, 0 hours of laboratory)

Prerequisite: BST 675 (Biometrics I)

Initial Offering: Spring 2010

Instructors: Any faculty member in the Department of Biostatistics

Philosophical Statement: Students pursuing a doctoral degree in epidemiology and/or biostatistics must be prepared to deal with issues in the collection, analysis, interpretation, and presentation of numerical data. This course is designed to provide students with an introduction to the fundamental theories that form the basis of the inferential statistical procedures that they will utilize in the study and practice of biostatistics. The course will emphasize inferential principles as they relate to biostatistical methods and to applications in public health and allied fields; however, the course will be conducted with enough mathematical rigor to avoid repeatedly asking students to take on faith results that should be understood in some depth. A special feature of the course will be the motivating "case studies" incorporated into the various units. Each case study will: demonstrate the application of inferential theory in public health, pharmaceutical science, or medicine; or, illuminate the rationale for a commonly employed biostatistical method.

Objectives: Students completing BST 676 will be able to:

- 1. Implement various point estimation, hypothesis testing, and interval estimation techniques when numerical data are supplied.
- 2. Understand the properties of point and interval estimators as well as approaches for comparing and evaluating them.
- 3. Understand the properties of hypothesis testing procedures as well as approaches for comparing and evaluating them.
- 4. Articulate connections between inferential principles and biostatistical methods.

Textbook: Larsen and Marx (2005). Introduction to Mathematical Statistics and Its Applications. Prentice Hall.

Detailed Outline:

- I. A Few More Useful Probabilistic Tools
 - a. Motivating case study #1: Modeling a distribution of blood pressure and cholesterol scores
 - b. Motivating case study #2: Finding an appropriate nonlinear transformation in regression
 - c. Joint and marginal probability mass/density functions
 - d. Univariate and bivariate transformations
 - e. Convergence in probability and Slutsky's Theorem
 - f. Resolution of motivating case studies
- II. More Techniques for Point Estimation
 - a. Motivating case study: Should cancer rate estimates be zero when there are no cases?
 - b. Bayesian posterior mode
 - c. Bayesian posterior mean

- d. Resolution of motivating case study
- III. More Techniques for Hypothesis Testing
 - a. Motivating case study: Why three tests for the global null in PROC LOGISTIC?
 - b. Wald tests
 - c. Score tests
 - d. Rank-based tests
 - e. Resolution of motivating case study
- IV. Techniques for Interval Estimation
 - a. Motivating case study #1: Can an interval for a cancer rate contain a negative number?
 - b. Motivating case study #2: Constructing intervals from non-normal point estimators
 - c. Inverting tests
 - d. Pivoting
 - e. Resolution of motivating case studies
- V. Evaluating Point Estimators
 - a. Motivating case study #1: What if the sample variance entailed division by n?
 - b. Motivating case study #2: Sample median and sample mean as competing estimators
 - c. Unbiased estimators
 - d. Mean square error
 - e. Consistency
 - f. Resolution of motivating case studies
- VI. Evaluating Hypothesis Tests
 - a. Motivating case study #1: Why require such huge sample sizes in clinical trials?
 - b. Motivating case study #2: Can a clinical trial have a positive result but not be definitive?
 - c. Power calculations
 - d. Unbiased, uniformly most powerful, and consistent tests
 - e. Comparing nominal and actual significance levels
 - f. Resolution of motivating case studies
- VII. Evaluating Interval Estimators
 - a. Motivating case study #1: When should one-sided intervals be used?
 - b. Motivating case study #2: How "approximate" is an approximate 95% interval?
 - c. Controlling the length of an interval
 - d. Unbiased and uniformly most accurate intervals
 - e. Comparing nominal and actual confidence levels
 - f. Resolution of motivating case studies

Note: Motivating case studies may vary from year to year.

Assessment: There will be regular homework assignments (40%), a midterm examination (30%), and a final examination (30%).

BST 676: Biometrics II

Course Description: This course, the second of a two-semester sequence in biometrics, develops numerous techniques for constructing and rigorously evaluating point estimators, hypothesis testing procedures, and interval estimators.

Course Structure: 4 credit hours (4 hours of lecture, 0 hours of laboratory)

Prerequisite: BST 675 (Biometrics I)

Initial Offering: Spring 2010

Instructors: Any faculty member in the Department of Biostatistics

Philosophical Statement: Students pursuing a doctoral degree in epidemiology and/or biostatistics must be prepared to deal with issues in the collection, analysis, interpretation, and presentation of numerical data. This course is designed to provide students with an introduction to the fundamental theories that form the basis of the inferential statistical procedures that they will utilize in the study and practice of biostatistics. The course will emphasize inferential principles as they relate to biostatistical methods and to applications in public health and allied fields; however, the course will be conducted with enough mathematical rigor to avoid repeatedly asking students to take on faith results that should be understood in some depth. A special feature of the course will be the motivating "case studies" incorporated into the various units. Each case study will: demonstrate the application of inferential theory in public health, pharmaceutical science, or medicine; or, illuminate the rationale for a commonly employed biostatistical method.

Objectives: Students completing BST 676 will be able to:

- 1. Implement various point estimation, hypothesis testing, and interval estimation techniques when numerical data are supplied.
- 2. Understand the properties of point and interval estimators as well as approaches for comparing and evaluating them.
- 3. Understand the properties of hypothesis testing procedures as well as approaches for comparing and evaluating them.
- 4. Articulate connections between inferential principles and biostatistical methods.

Textbook: Larsen and Marx (2005). Introduction to Mathematical Statistics and Its Applications. Prentice Hall.

Detailed Outline:

- I. A Few More Useful Probabilistic Tools
 - a. Motivating case study #1: Modeling a distribution of blood pressure and cholesterol scores
 - b. Motivating case study #2: Finding an appropriate nonlinear transformation in regression
 - c. Joint and marginal probability mass/density functions
 - d. Univariate and bivariate transformations
 - e. Convergence in probability and Slutsky's Theorem
 - f. Resolution of motivating case studies

II. More Techniques for Point Estimation

- a. Motivating case study: Should cancer rate estimates be zero when there are no cases?
- b. Bayesian posterior mode
- c. Bayesian posterior mean

- d. Resolution of motivating case study
- III. More Techniques for Hypothesis Testing
 - a. Motivating case study: Why three tests for the global null in PROC LOGISTIC?
 - b. Wald tests
 - c. Score tests
 - d. Rank-based tests
 - e. Resolution of motivating case study
- IV. Techniques for Interval Estimation
 - a. Motivating case study #1: Can an interval for a cancer rate contain a negative number?
 - b. Motivating case study #2: Constructing intervals from non-normal point estimators
 - c. Inverting tests
 - d. Pivoting
 - e. Resolution of motivating case studies
- V. Evaluating Point Estimators
 - a. Motivating case study #1: What if the sample variance entailed division by n?
 - b. Motivating case study #2: Sample median and sample mean as competing estimators
 - c. Unbiased estimators
 - d. Mean square error
 - e. Consistency
 - f. Resolution of motivating case studies
- VI. Evaluating Hypothesis Tests
 - a. Motivating case study #1: Why require such huge sample sizes in clinical trials?
 - b. Motivating case study #2: Can a clinical trial have a positive result but not be definitive?
 - c. Power calculations
 - d. Unbiased, uniformly most powerful, and consistent tests
 - e. Comparing nominal and actual significance levels
 - f. Resolution of motivating case studies
- VII. Evaluating Interval Estimators
 - a. Motivating case study #1: When should one-sided intervals be used?
 - b. Motivating case study #2: How "approximate" is an approximate 95% interval?
 - c. Controlling the length of an interval
 - d. Unbiased and uniformly most accurate intervals
 - e. Comparing nominal and actual confidence levels
 - f. Resolution of motivating case studies

Note: Motivating case studies may vary from year to year.

Assessment: There will be regular homework assignments (40%), a midterm examination (30%), and a final examination (30%).

Grading Scale:
