#### **COURSE OVERVIEW**

## **Course Description**

The application of statistical concepts, computations, and software to forestry sampling and inventory problems. Land, individual tree and timber stand measurement techniques will be covered as will the design and implementation of sampling systems to derive information necessary to meet landowner objectives. *Prerequisites: MA 109 or Calculus, FOR 100, and FOR 200.* 

# **Student Learning Outcomes**

At the end of this course, the student will be able to demonstrate the following skills.

- 1. Apply basic statistical concepts to analyze and solve a given problem.
- 2. When given a particular scenario, you will be able to use basic statistical software programs to input the data and solve the problem.
- 3. While in the field, you will be able to take land and standing tree measurements using a compass, prism, d-tape, global positioning system, Biltmore stick, and increment borer. Using these tools, you will be able to take land measurements to measure distances and determine area, and take standing tree measurements to determine height, form expressions, crowns, age, volume, and weights.
- 4. For a given field site, you will be able to design and conduct a timber inventory that meets specific landowner objectives. You will be able to apply sampling theory and design concepts to ensure appropriate sampling methods and units of measurement are used when designing and conducting the timber inventory.

- 5. When given wood product data, including specialty wood products, you will be able to calculate the weight, volume, and cost of the wood product and, as needed, apply log rules to determine volume.
- 6. Explain the basic concepts of site, stocking, and density.
- 7. Explain the basic concepts of growth and yield models.
